DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1, 9-13 are rejected under 35 U.S.C. 102(b) as being anticipated by Kling et al, US. Pat. No. 6,367,023.

3. Claims 1, 12-13, Kling teaches an information processing apparatus [*title, abstract*], comprising:

detection means for detecting a current flowing through a predetermined electrical path in said information processing apparatus [*current meter, col. 3, lines 55-59, col. 7, lines 39-47*];

first output means for outputting [*col. 3, lines 37-43*], when a level of said current detected by said detection means exceeds a predetermined limit level, a first signal indicating so [*col. 7, lines 50-54*];

second output means for outputting, when said first signal is outputted by said first output means, a second signal commanding that a clock frequency of said information processing apparatus be reduced [*throttle signal of Fig. 3, col. 4, lines 50-54, col. 9, lines 28-30*]; and

frequency control means [*clock synchronizer 311 of Fig. 3*] for controlling such that, when said second signal is outputted by said second output means, said clock frequency of said information processing apparatus is reduced [*col. 6, lines 34-38*].

Art Unit: 2116

4. Claims 9, Kling teaches a CPU [*see Fig. 1*]; and a sensor that measures a temperature of said CPU and outputs a measured value, wherein said second output means also outputs said second signal when said measured value outputted from said sensor exceeds a predetermined value [*col. 1, lines 38-46*].

5. Claims 10-11, Kling teaches a CPU which includes a control terminal shared with a monitor, and which executes control which is control for said control terminal and where its own operations are periodically and repeatedly paused at a predetermined cycle, wherein said CPU obtains said second signal via said control terminal when said second signal is outputted by said second output means, and performs said control for said control terminal [*video terminal 145 of Fig. 1, see related disclosure*].

Allowable Subject Matter

6. Claims 2-8, objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
